B The stages, in order, with the jobs each needs and the decision it informs
1 export (grid-cpu): the truth table and the PDM points exist and the three frame gaps are numbers (0 jobs only if the line-end export and morphoview reach the pinned copy before the two counted morphometry jobs are sent)
2 features with no network (grid-cpu): whether named measurements name as well as a latent at the feature level, under the exact rule and a classifier, and what K is; the within-column correlation that sets the naming bar
3 smoke of the heads (grid-cpu): the six heads run end to end and the GPU step time is measured (one more block value in the phantom_smoke plan, else one CPU job as a heads_smoke plan of the same flow)
4 real spines (grid-gpu): the primary endpoints per arm with intervals, from a fixed design of eighteen trials every one read on test (1 in the minimal form A against C)
5 report (container): greg's decision against the bars he set
