B part C again
points lost against its own table
bodies seen
C what it says, when it says it
right when it answers (%)
bodies seen
D what the gold tier can test
one cell
one of the seven's 154 cells, Bonferroni
against Panjabi's 12 as a sample (Welch)
least mean shift found (person SDs)
persons with whole spines
E spread and correlation
least SD ratio found
against Panjabi's 12 as a sample (F)
1 + half-width of a neighbour r of 0.5
ratio, or 1 + half-width
persons with whole spines
F anomalies to expect
six lumbar-type segments (L6 or lumbarised S1)
of which a true L6
four lumbar segments (sacralised L5), a ceiling
a rib on the first lumbar-type body
no twelfth rib, one side or both
columns expected
persons with whole spines
B and C: the rule's table (bars: the range over its 4 tables)
own table
part C, 0.3 SD level by level
part C, seven-r0
39 papers, all
39 papers, without tan2004
39 papers, same definition only
39 papers, all, one shift for every measure
